A	MATCHING	
	All repertoires below should be under Generalized Reinforcement (GR)	**The antecedent for match responses should include the spoken names of the stimuli (e.g., "Match the bear")**
1	Visually matches novel stimuli	Matches across irrelevant dimensions (non-identical) while teacher tacts the relevant dimension. (Abstractions): (e.g., "Match red")
a	Colors	
b	Shapes	
2	Object construction imitation	Duplicates 5 novel objects built with 3-5 blocks by duplicating structure after watching the teacher construct the object. When providing a correction, first place the teacher and student structures together to show that they are not the same before presenting the correction procedure.
3	Object construction emulation	Duplicates 5 novel objects built with 3-5 blocks by duplicating structure only seeing the completed product, not the construction. When providing a correction, first place the teacher and student structures together to show that they are not the same before presenting the correction procedure.
4	Uses "point to" topography to match pictures	Alternative to placing the sample picture over the target responses when the teacher presents the target, and the student has two or three non-exemplars. A: "Point to _____," "Find the same," "Show me the same":
B	**GENERAL KNOWLEDGE (Listener and Speaker)**	
	All repertoires below should be under Generalized Reinforcement (GR)	**Criteria indicate the number of target stimuli presented with 100% accurate responses. For example, 10/10 would require that the student accurately identify 10 different stimuli with one opportunity per stimulus.**
1	Sorts items by category	Sorts objects or pictures into categories such as food, clothing, animals, vehicles, letters with 5 per category across 5 categories.
2	Responds to categories above	Rotate learn units between sorting and tacting category
